Taiwan International Ports Corporation Environmental Policy

"Leverage innovation effectively to connect and communicate with global trade flows. Mature into a world-class port management group" is the vision of Taiwan International Ports Corporation (TIPC). TIPC manages and operates commercial ports in Taiwan and is engaged in maritime transport related services, free trade zones, and the development of relevant tourism and recreational projects.

While TIPC pursues business growth, we are well-aware of the importance of our social responsibility, which is to ensure both environmental and economic sustainability. With the goal to establish green and sustainable ports, we will proactively identify environmental risks that may be associated with our activities and manage the risks accordingly to minimize the environmental impacts.

We commit to:

1. Implement and follow through with the Green Port Programme to establish extraordinary world-class ports;
2. Comply with applicable environmental regulations to fulfill corporate environmental responsibility;
3. Execute pollution prevention, monitoring, and control mechanism to enhance environmental quality in and around port areas;
4. Reinforce environmental education to cultivate environmental awareness among employees; and
5. Strengthen the communication with local communities, and pursue sustainable development for both the ports and the cities where we are operating.

Men-Feng Wu
Chairman of TIPC

Port of Kaohsiung, Taiwan International Ports Corporation Environmental Policy

The Kaohsiung Branch of the Taiwan International Ports Corporation (TIPC) understands its role as a port management entity responsible for maintaining and improving the port environment. Additionally, we ought to consider environmental protection as a part of sustainable management. Therefore, we are committed to reducing environmental impacts resulting from port operations, as well as to providing an environmentally friendly, sustainable, and progressive port of high quality. To ensure that the port environmental performance is consistent with its environmental policy, the following principles will be implemented:

- Fully apply the environmental management system; promote sustainable development of the green port
- Follow environmental laws and regulations; endeavor to fulfill corporate social responsibility initiatives
- Provide appropriate environmental education and training; enhance the environmental awareness and skills of our employees
- Continue environmental monitoring and pollution control; reduce energy consumption, carbon emissions, and environmental load
- Disclose environmental information regularly; establish a bridge of communication between the inner and outer port
- Encourage adjacent communities to participate in creating a friendly environment in the port city

The environmental policy will be effectively conveyed to employees, shipping companies, lessees (or contractors), and residents of adjacent communities. The policy is available on the official website of the Kaohsiung Branch of the TIPC.

Chen Shao Liang

President of Port of Kaohsiung, TIPC

Date: 2017. 7. 20

Environmental Objectives

To achieve our commitments in environmental policy, the following environmental objectives are set according to the ten major environmental impacts from the port:

- **Improve Port Water Quality:**
Plan a waste water runoff treatment system for the port area and monitor the long-term water quality of the port area
- **Improve Air Quality:**
Monitor air quality in the port area; perform environmental inspections of the port area and environmentally friendly strategies to implement on ships
- **Prevent Dust in the Port Area:**
Enforce stricter port area operational measures for effective dust control
- **Reduce Port-generated Waste:**
Avoid unnecessary resource waste through the appropriate disposal of waste and implement the recycling and reuse of resources
- **Reduce Marine Sediment Pollution:**
Periodically dredge the waterways to reduce sediment pollution in port water areas
- **Reduction of Noise within the Port Area:**
Monitor noise in the port area and increase control over operational and transportation noise
- **Strengthen Hazardous Cargo Management:**
Improve the management of dangerous goods and strengthen port safety
- **Improve the Management of Vessel Sewage Discharge:**
Effectively control and manage the flow of waste oil and sewage discharged by ships
- **Appropriate Disposal of Dredged sediment:**
Effectively use recycled sediment as materials for land filling
- **Abate Ship Emissions :**
Promote vessel speed reductions and a shore power system and reduce exhaust emissions from ships

The President of the Kaohsiung Branch of TIPC is responsible for implementing, upholding, and communicating the environmental policy, and for reviewing the environmental policy annually to meet commitments, make continuous improvements, and achieve environmental objectives.

Chen Shao Liang

President of Port of Kaohsiung, TIPC

Message from TIPC

01/

Message from the Chairman of Taiwan International Ports Corporation ,Ltd

The Taiwan International Ports Corporation, Ltd. (TIPC) is committed to advancing port infrastructure, improving facility and service, optimizing land use and preventing pollution. In recent years, we have been networking with global ports and active in international certification schemes of port environment management. The environmental performance of ports in Taiwan is thus recognized by the world. With our global presence, we are well positioned to achieve our goal as building Ecoport and Green Port.

Sustainable development has been the foundation on which the TIPC has been built. It is our strong belief that long-term operation and success are not possible without social, economic and environmental prosperity. We are dedicated to carrying out our mission of creating the best investment environment for the port business as well as the livable life for the neighboring communities.

At the TIPC, we will continue the collaboration and communication with shipping companies, port business, neighboring communities and local governments. Together with public authorities and citizens, we will seek ways to build ideal international green ports for all.

Meng-Feng Wu

Meng-Feng Wu
Chairman
Taiwan International Ports Corporation, Ltd.

Message from the President of Taiwan International Ports Corporation ,Ltd

Changes in the global climate and the quality of the marine environment have contributed to a wide attention on pollutions created during ship operations as well as greenhouse gas emissions produced during international shipping. As one of the world' s most advanced port operators, the Taiwan International Ports Corporation, Ltd. (TIPC) takes into account climate risks when designing its port facilities. Moreover, we actively establish environmental management system and enable public access to port-related environmental information.

Environmental policy is the guiding principle of environmental management in our ports. We work toward minimization of the negative impact on port environment during port operations and development. As of today, the Ports of Kaohsiung, Keelung, Taichung, Hualien and Taipei have received the EcoPort certification of the European Sea Ports Organization.. The Ports of Hualien and Taipei are planning to implement such certification system this year and thus joining the global network of EcoPort.

As a transportation hub in the Asia-Pacific region, Taiwan ports shoulder the responsibility of promoting international trade and shipping development. TIPC will continue to provide the shipping industry with high-quality services so that ports and the local cities coexist in harmony and work jointly to facilitate mutual developments. Such partnership will allow the ports to continue to innovate and will improve our competitiveness. Now and in the future, all of our staff members will work diligently to protect the environment and ensure sustainable port development.

Tien Kuei Kuo

President
Taiwan International Ports Corporation, Ltd

Message from the President of Port of Kaohsiung Taiwan International Ports Corporation ,Ltd

The gradually growing awareness at major ports around the globe that port development and environmental protection are inseparable has created a trend of port development that focuses on environmental sustainability. Advanced countries have focused on combining the concepts of green operations and sustainability with port management. With port development aims of achieving low pollution, low energy consumption, environmental restoration, and combined benefits for the surrounding communities while sustaining economic benefits, focuses have been placed on designing suitable port plans, production operations, and protective measures of the surrounding environment.

As one of Taiwan' s seven major international ports, Anping Port plays a crucial role in the development of the shipping industry. Since its conversion to a government-owned entity in 2012, the Anping Port Branch Office of the Port of Kaohsiung, Taiwan International Ports Corporation has continued to promote the development of the trade and commercial port tourism industries and pursue increased economic benefits from the port and harbor, to uphold its responsibility as a port management unit to maintain and improve the port environment. The Office is committed to including environmental protection as an integral part of sustainable port management, minimizing the impact of port operations on the environment, and progressing towards our goal of becoming a green port. In 2016, Anping Port earned recognition as an international EcoPort. Anping Port will continue to promote green port oriented measures to achieve a balance between the ecosystem, port-city development, and port operating interests.

Chen Shao Liang

President of Port of Kaohsiung
Taiwan International Ports Corporation, Ltd

Port Profile

02/

2.1 Port Location and Port Area

The Port of Anping is located on the southwest coast of Taiwan (22°59' north latitude and 120°09' East longitude). The total area of the port district is about 18.21 square kilometers. Its land area is 2.11 square kilometers, interior water area is 2.77 square kilometers and the water area outside the port is 13.33 square kilometers. The port is 180 meters wide, its main channel depth is 12 meters, and the mean tidal range is 0.57 meters.

Anping Port is located in Tainan on the southwest coast of Taiwan between the Erren and Yanshui Rivers, about 40 kilometers north of the Port of Kaohsiung and 140 kilometers south of Taichung

Port. During the Qing dynasty, Anping Port was the gateway to Tainan Prefecture, then Taiwan's main urban center, and as such was the largest port in Taiwan at the time. However, longshore drift resulted in the silting in of the port and led to its decline. In 1997, the Ministry of Transportation and Communications designated Anping Port as an auxiliary port to the Port of Kaohsiung in an effort to promote local economic development. Anping Port functions as an international commercial port, and international merchant ships can operate here.

Geographical Map of Anping Port

2.2 Legal Status and Port Operators

To promote modernized commercial port management system reforms, The Taiwan International Ports Corporation, Ltd. Establishment Act was promulgated on November 9, 2011, Taiwan amended the Commercial Port Law on December 28, 2011. It was then decided in March 2012 that the government should be separated from the enterprise for management of the ports. Public entities that used to manage the ports, including: Kaohsiung Harbor Bureau, Taichung Harbor Bureau, Keelung Harbor Bureau and Hualien Harbor Bureau, are integrated into a corporation

(Taiwan International Ports Corporation, TIPC) to reduce legal and institutional restrictions on commercial port operations, enhance the ability of ports to respond to market changes, and increase their competitiveness. After the transformation, management of the Port of Kaohsiung is now the responsibility of the Kaohsiung Branch of TIPC. The Southern Taiwan Service Center of Maritime and Port Bureau (MPB), Ministry of Transportation and Communications (MOTC) will be in charge of navigation and management of issues related to public authority.

MASTER PLAN OF PORT OF ANPING

2.3 Commercial Activities 2.4 Main Cargoes

Anping Port offers 17 docks, 2 of which are designated as chemical product dockage for Chi Mei Corporation (CMC). The total length of the docks is 3,196 meters. Their types include breakbulk and sundry goods docks, passenger and goods docks, chemical products, bulk cargo docks, and port service docks.

The main inbound cargos in 2015 were chemical or related industrial products(81.72%) and mineral products(17.32%). Outbound cargos were mainly chemical or related industrial products (100%).In 2016 were chemical or related industrial products(64.83%) and mineral products(17.42%).Outbound cargos were mainly chemical or related industrial products (97.41%) and animal or vegetable fats and oils and their byproducts(2.59%).

*Environmental
Management*

03/

3.1 Organizational Structure

Environmental management of the Anping Port District is enforced by the Anping Port Branch Office, Port of Kaohsiung, TIPC in accordance with the allocation of responsibilities stipulated in the Commercial Port Law and the Marine Pollution Control Act. The Anping Port Branch Office is in charge of environmental issues in port operations and management. The Anping Maritime and Port Section of the South Maritime Affairs Center handles environmental issues involving public rights. The Tainan City Government's Environmental Protection Bureau is in charge of environmental issues covered in the Marine Pollution Control Act.

The Harbor Management Section of the Anping Port Branch Office handles that organization's environmental management duties. The Harbor Management Section's duties are port district security management and disaster incident related duties, port district pollution prevention, environmental regulations, environmental impact assessment, environmental monitoring, oil pollution and toxic disaster emergency incident response, environmental education, port ecological conservation, plant conservation, and recycling. There are two personnel in charge of environmental protection.

>> Organizations involved in coping with the environmental issues in the port area of the Port of Anping

Figure of Organization chart of Anping Port

3.2.1 Relevant International Regulations

Anping Port Branch Office follows relevant international specifications, such as International Convention for the Prevention of Pollution From Ships (MARPOL73/78), International Convention for

the Control and Management of Ships' Ballast Water and Sediments, International Convention on the Control of Harmful Anti-fouling Systems on Ships etc.

3.2.2 Relevant Environmental Laws and Regulations in Taiwan

The Anping Port Branch Office collaborates with local authorities to manage the environment in the

Port in compliance with relevant environmental laws and regulations in Taiwan.

*State of the
Environment*

04/

Enhance Port Water Quality

The Anping Port Branch Office has committed to facilitating the establishment of rainwater treatment facilities. The port completed construction on the port district wastewater end-stage processing facility in 2005. Its wastewater processing capacity was certified by the Tainan City Government's EPB as having a daily maximum processing capacity of 80 m³. It can

Water Quality Monitoring

The Anping Port area currently provides 5 water quality monitoring stations, at Yukuang Elementary School, Leli Bridge, Yunghua Bridge, the exit point of the port basin, and downstream from the Anping industrial sewage treatment plant's discharge port. Inspection items include water temperature, pH, dissolved oxygen, and E. coli. Sea water quality is monitored

effectively process domestic wastewater in the port district and prevent pollution from incidental wastewater discharge. Anping Port is currently working towards its goal of separating surface rainwater runoff and wastewater runoff into two different systems. It hopes to effectively reduce the generation of runoff wastewater pollution in the wharf area through the construction of a dedicated drainage system.

seasonally, and the data indicate that all water quality indicators in the port area meet regulatory standards. Follow-up planning for Anping commercial port area wastewater: Domestic waste from the passenger service center and office buildings is piped to the wastewater treatment station at each terminal for treatment and discharged when it meets discharge standards.

>> Records of 2015, 2016 Anping Port Water Quality

Indicators	Standards	Measurements	Pass rate(%)
pH	7.5~8.5	7.9~8.3	100
DO(mg/L)	≥2.0	4.1~6.7	100
BOD ₅ (mg/L)	≤6.0	≤4.1	100

Note : Environmental quality standards for class III marine water bodies are referenced when examining the port's water quality

Improve the Management of Vessel Sewage Discharge

Vessel waste oil and wastewater cleanup businesses must apply and present the relevant documentation before they can conduct vessel waste oil and wastewater collection within the port.

Certified businesses must report the amount processed each month. Statistics show that 50.4 tons of vessel waste oil and wastewater was cleaned up in Anping Port in 2015, and 21.01 tons in 2016.

Air Quality

Major sources of air pollution in Anping Port Branch Office are emissions from the burning of marine fuel oils onboard ships within the port area, port operators' vehicle and loading equipment exhaust emissions, including NO_x , SO_2 and $\text{PM}_{2.5}$ and so on.

Anping Port Industrial District and the Ssu Kun Shen Checkpoint have a total of 8 entry and exit lanes, four of which are automatic gates. Vehicles passed through the gates 143,384 times in 2015 and 178,300 times in 2016.

Air Quality Monitoring

The Anping Port area currently has 4 fixed-site air quality monitoring sites, including the visitor center, Hsinkang bridge, Yitsai Elementary School, Yukuang Branch School, and Lungkang Community.

The idling and waiting time for vehicles entering and exiting the gates has been reduced and the port has increased the efficiency of its entry and exit process, aiding in the reduction of carbon emissions.

Anping Port joined the Tainan City Government EPB in establishing a clean air zone on January 1st, 2016. After a long period of advocacy and inspections, 237 out of 343 registered vehicles had already obtained the inspection-free label. The rate of vehicles obtaining the label is 69.1%.

Automatic gate control system

Monitoring for Total Suspended Particles (TSP), PM_{10} , $\text{PM}_{2.5}$, SO_2 and ozone is performed once per season. All data resulting from air quality monitoring in 2016 met air quality standards.

Results

Pollutant (Unit)	TSP ($\mu\text{g} / \text{m}^3$)	PM_{10} ($\mu\text{g} / \text{m}^3$)	$\text{PM}_{2.5}$ ($\mu\text{g} / \text{m}^3$)	SO_2 (ppm)	NO_2 (ppm)
Averaging Time	24 hours	24 hours	24 hours	1hour	1hour
Standards	250	125	35	0.25	0.25

Shore-side Power Supply

Shore power system

The port area is currently equipped with 7 electrical facilities that are used by ferries, tugboats, and private yachts.

Dust Pollution Reduction

Dust in the Port of Anping is mainly derived from stevedoring operations at bulk and general cargo terminals as well as from wind erosion and vehicle-based road emission.

In terms of dust reduction, the Anping cement loading dock and coal unloading facility have adopted enclosed warehouses, not only increasing the efficiency of ship unloading operations but also fully reducing the dispersion of particulate matter pollutants during the unloading process.

The dock is equipped with 4 vehicle washing stations. Bodies and tires of transport vehicles must be sprayed and cleaned of fugitive particulate matter before permission to exit can be granted.

The Tainan City Government Water Resources Recycling Center has a reclaimed water intake port installed at Anping's commercial port for irrigating trees within the port area or cleaning ground surfaces and suppressing airborne dust caused by port operations. The total capacity of the reclaimed water used at Anping Port was approximately 7,606 tons in 2015 and 4,748 tons in 2016.

Reuse water intake location

#31 wheel washes

Water reuse

Fully-automatic coal unloading enclosed warehouse

The enclosed warehouse at Dock No. 29 and No.30 has effectively reduced dust generated during coal stevedoring. From 2015 to 2016, a total of 67,347 tons of coal had been unloaded from these docks. The maximum capacity of the

enclosed warehouse is approximately 800 tons per hour. This is more efficient than traditional grapple operations, which has a coal unloading capacity of 600 tons per hour.

#29,30 Enclosed warehouse

Automatic coal unloader

Mobile Pollution Source Control

Vehicles traveling on land in the Port of Anping are another source of air pollution. The Anping Port Branch Office and the Tainan City Government's EPB have collaborated to promote air quality purification advocacy and inspections since January 1, 2016 and Anping Port has officially been designated an air quality purification area; the port has also required Chi Mei Corporation's outsourced chemical tankers and EGC Cement Corporation's transport vehicles within the port area to carry out self-management.

Billboard of the clean air zone

Between January 1 and December 15, 2016, 17 advocacy and inspection tasks were performed at the Ssu Kun Shen Checkpoint and the main entrance on Xinxing Road. Inspections of 249 vehicles were completed; only 2 vehicles failed inspection. These inspections ensured that vehicle emissions in the Anping Port clean zone are below the vehicles' factory regulatory standards, thereby minimizing vehicle exhaust pollution in the clean zone.

Vessel Speed Reduction

To reduce pollution caused by shipping, Anping Port completed the setup of the AIS ship deceleration verification system in 2015 to control the records of ship speeds for ships entering and exiting the port. In port affairs discussion forums, ocean carriers, shipping agencies, and the relevant port operators are advised to reduce ship speeds to 12 knots within 20 nautical miles of port entry or exit to cooperate in implementing air pollution control measures. In 2016 the port, achieving approximately a 72% deceleration rate. The total speed reduction was equivalent to an estimated reduction of 1,153 tons of carbon dioxide emissions per year.

The AIS for ship deceleration

Resource Consumption

Waste generation and treatment

Regarding onshore waste in the Anping Port area, the port district set up recycling bins for vessels to recycle and prevent garbage from being scattered on the wharf and falling into the dock basin. In 2015, the onshore area of Anping Port generated 88.3 tons of garbage and recycled 12.6 tons, for a recycling rate of 14.3%. In 2016, it generated 92.3 tons

of garbage and recycled 11.7 tons, for a recycling rate of 12.7%, still above the target recycling rate of 10%. The future goal is to increase the general garbage recycling rate to 15% to reduce the amount of garbage and increase the amount of recycled materials.

>> Collection amount of ship oily wastewater

Year	Vessel	Oily wastewater (ton)
2015	1	50.40
2016	1	21.01

>> Waste recycle & disposal amount at the Port of Anping

Item	2015	2016
Total waste generation(ton)	88.3	92.3
Recycle (ton)	12.6	11.7
Recycle Rate (%)	14.3	12.7

Watsons Volunteer Beach Cleanup Day

The Four-Saving Project

The Port of Anping applies the Four-Saving Project with the goals of annual power, fuel, water and paper consumption reduction to decrease resource consumption and waste production of the port.

Electricity Usage(kwh)

The electricity usage increases with the electricity demand.

Fuel Usage(L)

To reduce fuel consumption, old two-stroke motorcycles and scooters within the port area are viewed as replacement targets. Replacing these aging motor vehicles can not only save on fuel consumption, it also reduces vehicle emissions, thus reducing air pollution.

Water Usage(m³)

The port's reduced water consumption can primarily be attributed to increasing public awareness of the need for water conservation. Additionally, the port coordinates with Tainan City's nearby Anping water resource recycling center in waste water treatment and recycling operations. By using reclaimed water for plant irrigation and vehicle washing stations, Anping Port saves an average of 5% on its tap water usage per year.

Paper Usage(Sheet)

Recent increases in the frequency of meetings means that paper use saw a slight increase in 2015 due to advancements in administrative operations. However, usage declined again in 2016 thanks to the implementation of a carbon inventory.

Noise

The Port of Anping is adjacent to urban areas and next to the industrial district. Consequently, the industrial activities and cargo transport in and nearby the port,

as well as the noise caused by port construction, tend to affect nearby residents' quality of life. Noise pollution is a public environmental concern as well.

Improvement Strategy

Anping Port constructed a sixty meter wide green belt and thirty meter wide Harbor road, with a total length of 1,500 meters. The road forms a nearly ninety meter wide buffer zone separating the port from the neighboring community. The Anping Port Branch Office has formulated a transportation route for large vehicles that takes them from the harbor road in the port

through the Ssu Kun Shen Checkpoint to the community outer ring road, and thence towards the West Coast Expressway. The route reduces crossover between port district and resident traffic, maintains pedestrian and vehicle safety, and greatly reduces port district noise impacts on the neighboring community.

Noise Monitoring

The Anping Port commercial port area observes noise control standards for type 4 control areas next to roads measuring at least 8 m. The port laid out 4 noise monitoring points, at Hsinkang bridge, Yukuang Branch School, the Anping industrial area control

station, and Lungkang Community to monitor nearby sensitive receptor zones, port traffic arteries, and loading areas. Environmental quality monitoring results in 2015 and 2016 show that 100% compliance with the port's noise control standards was achieved.

Time period	Day Level	Evening Level	Night Level
Road Category D Noise Control Criteria : dB(A)	75	70	65
Next to roads that are wider than 8 m	76	75	72

Noise monitoring

Green buffer

Strengthen Hazardous Cargo Management

Chemical storage and transportation businesses within Anping Port could potentially be the source of a large number of environmental hazards. Leakages would pose grave dangers, both to the ecosystem and to neighboring residents. Therefore, Anping Port conducts routine monthly inspections, biannual port district safety joint oversight operations, and quarterly port facility security drills (ISPS) in accordance with commercial port law, the regulations for port services at commercial ports, the Toxic Chemical Substances

Control Act, the Occupational Safety and Health Act, regulations for vessels carrying dangerous goods, and the International Maritime Dangerous Goods Code. All port authority units at Anping Port District are self-managed and have corresponding emergency response plans. Government agencies and private businesses conducted a joint national toxic chemical spill disaster response drill at Anping Port in 2016 to strengthen their emergency response capabilities in the event of an accident.

>>Inspections and Drills Conducted in 2015-2016

Year	2015	2016
Inspections	20	28
Drills	5	6
Cross Agency Inspections	2	2

The petrochemical and chemical storage and transportation industries within Anping Port are businesses with potential for considerably high-risk environmental hazards. In the event of emergencies, spills or leakages could endanger the ecosystem and neighboring residents. Therefore, the implementation of cargo

management and reinforcement of port safety is viewed as a major environmental issue at Anping Port. For their part, all business operations must have corresponding emergency response plans and periodically organize disaster drills, while also cooperating in joint port drills to strengthen emergency response capabilities in case of accidents.

In accordance to current regulations, the Anping Port Branch Office stipulates a set of operating procedures for a variety of dangerous cargo. Anping Port conducts at least 48 inspections of loading processes each year to ensure and maintain proper handling of dangerous cargo in the port area. Additionally, the Anping Port Branch Office communicates with each unit from time to time to increase the

response capabilities of relevant units in the event of cargo leak emergencies. Moreover, at least 4 port area emergency drills are planned per year. In 2015, 4 ISPS drills and 1 ocean pollution drill (for a total of 5 drills) were carried out. In 2016, 4 ISPS drills, 1 ocean pollution drill, and 1 toxic disaster drill (for a total of 6 drills) were carried out.

Cargo Vehicle Inspection

Safety Check

Inspection of vessel pollution control certification (including air, water, and waste oil)

Drills(ISPS)

Greenhouse Gas Emissions

Carbon Emissions from Ships

The Taiwan air pollution emission [TEDS 8.1] line source manual calculation formula was adopted to estimate carbon emissions by ocean-going vessels:

Note:
Fuel consumption amount (L) = Cargo throughput (L) × Energy density (L/ton kilometer) × Harbor travel distance (km) × 1000 (kg/metric ton)

A ship entering the harbor may switch to marine diesel oil, the properties of which are similar to those of regular diesel fuel. Therefore, the 2015 diesel fuel carbon emission factor in the EPA carbon factor database is used as a reference for the emission factor.

Ocean-going ship carbon emissions(KgCO_2e) =
Fuel consumption amount (L) × Emission factor($\text{KgCO}_2\text{e/L}$) × Control factor

>> 2015-2016 Ocean-Going Ship Carbon Emissions in Anping Port

Year	Total Cargo Throughput (tonne)	Energy Density (L/tonne-km)	Harbor Travel Distance (km)	Fuel Consumption (L)	Emissions Factor ($\text{kgCO}_2\text{e/L}$)	Carbon Emissions (tonne)
2015	1,096,635	0.003	12	39,478,860	2.65	104,619
2016	1,437,896	0.003	12	51,764,256	2.65	137,175

>> Carbon Emissions from Resource Consumption

Resource	2015		2016	
	Amount of Resource Consumed	Carbon Emissions (tonne)	Amount of Resource Consumed	Carbon Emissions (tonne)

Total		498	-	602

Pollution Reduction in Marine Sediments

The Anping Branch Office conducts sediment monitoring operations in the port district each quarter. Results show that heavy metal concentrations in sediments at the port's monitoring stations are clearly higher than those at monitoring stations outside the port. Sediment monitoring in the area outside of the port has generally resulted in lower values in recent years and accords with sediment quality standards. Regarding excessive heavy metal concentrations in sediments in the

Anping Port District, the Anping Branch Office conducts periodic dredging of port district channels. It also requests the Tainan City Government's EPB and Water Resources Bureau to conduct sectional monitoring and dredging of rivers in accordance with the River and Ocean Pollution Prevention and Control Unit Meeting Platform and the specifications of the Sediment Quality Indicator's Classification, Management, and Usage Restrictions.

Appropriate Disposal of Dredged Sediment

To pursue greater efficiency in the utilization of resources, Anping Port maintains a balance between dredging and reclamation in the port area by recycling the sediments excavated in channel dredging operations to use as backfill in construction work at the Port of Kaohsiung. To ensure navigational safety of ships in the port channel, channel dredging operations are periodically carried out every year. In 2013 and 2014, Anping Port decided on pseudo-solidification of a portion of the sediments dredged from the nearby channel. Other portions of the sediments

were moved to the breakwater next to Anping Port's northern seawall for beach maintenance. The amount of soils dredged in Anping Port in 2016 came to 1,098,400 tons. To meet its resource utilization efficiency target, Anping Port recycled sediments from channel dredging and shipped them to the Port of Kaohsiung for site expansion and filling. The 100% backfilling rate accords with the disposal principles of the London Marine Dumping Convention.

Environmental Performance Indicators of Anping Port

Significant environmental issues	Index item	Calculation method	Target value	Indicator presentation (calculation details)	
				2015	2016
Water Quality	Marine water quality pass rate (pH, DO, BOD5, TP, cyanide, phenols, mineral oils)	The ratio of port water quality measurements (obtained at the water quality monitoring station in the port) satisfying the Marine Environment Classification and Quality Criteria	Marine water quality: 100% of the quarterly pH, DO, cyanide, metal oils, and BOD ₅ measurements satisfy the criteria	Marine water quality criteria for Category C pH 100% DO 100% BOD5 100% Cyanide 100% Phenols 100% (1+1)÷2×100%=100%	Marine water quality criteria for Category C pH 100% DO 100% BOD5 100% Cyanide 100% Phenols 75% (1+1)÷2×100%=100%
	Ratio of the regulated businesses or wastewater (sewage) treatment permits in the port obtained approval for their water pollution prevention plans.	Number of regulated businesses or wastewater (sewage) treatment permits in the port that have obtained approval for their water pollution prevention plans ÷ Total number of businesses producing wastewater (sewage) in the port that should be regulated × 100%	All the regulated businesses or wastewater (sewage) treatment permits (100%) in the port have obtained approval for their water pollution prevention plans.	Total number of businesses in the port that produce wastewater (sewage): 2 Number of regulated businesses in the port that have obtained approval for their water pollution prevention plans: 1 Number of businesses in the port that are not regulated by the Water Pollution Control Act to commission wastewater (sewage) treatment contractors or do not discharge wastewater: 1	Total number of businesses in the port that produce wastewater (sewage): 2 Number of regulated businesses in the port that have obtained approval for their water pollution prevention plans: 1 Number of businesses in the port that are not regulated by the Water Pollution Control Act to commission wastewater (sewage) treatment contractors or do not discharge wastewater: 1
Air Quality	Air quality pass rate (PM ₁₀ 、PM _{2.5} 、SO ₂ 、NO ₂)	The ratio of the measurements in the air quality monitoring station of the port that meet the "Air Quality Standards"	- PM₁₀ of the daily mean measurements satisfy the standard (<125μg / m³): 100% - PM_{2.5} of the daily mean measurements satisfy the standard (<35μg / m³): 60% - SO₂ of the daily mean measurements satisfy the standard (<0.1 ppm): 100% - NO₂ of the hour average measurements satisfy the standard (<0.25 ppm): 100%	- PM₁₀ of the daily mean measurements satisfy the standard: 100% - PM_{2.5} of the daily mean measurements satisfy the standard: 88% - SO₂ of the daily mean measurements satisfy the standard: 100% - NO₂ of the hour average measurements satisfy the standard: 100%	- PM₁₀ of the daily mean measurements satisfy the standard: 100% - PM_{2.5} of the daily mean measurements satisfy the standard: 100% - SO₂ of the daily mean measurements satisfy the standard: 100% - NO₂ of the hour average measurements satisfy the standard: 100%
	Promotion of a comprehensive use of the Automatic Gate Sentry Post Control System among shipping lines	The ratio of incoming and outgoing roadways installed with an automatic gate sentry post control system	Ratio of gates with automatic sensory: 50%	The ratio of incoming roadways installed with an automatic gate sentry post control system: 2÷4×100%=50% The ratio of outgoing roadways installed with an automatic gate sentry post control system: 2÷4×100%=50%	The ratio of incoming roadways installed with an automatic gate sentry post control system: 2÷4×100%=50% The ratio of outgoing roadways installed with an automatic gate sentry post control system: 2÷4×100%=50%

務股份有限公司高雄港務分公司安平港營運處
變演練暨國際船舶與港口設施保全(ISPS)演習

5 Emergency Response

In order to maintain port safety, the Anping Port Branch Office conducts daily land and marine environment inspection. When any suspicious behavior was identified, the inspection personnel will immediately notify for correction or inform competent legal authorities for legal enforcement. In 2015 and 2016 there have been no occurrences of fishing boat induced navigational safety incidents, small-scale oil spills within the port district, waste and fire alarms, ship collisions, fires, explosions, oil spills, chemical spillage, occupational safety incidents (with personnel casualties), or other accidents or incidents.

For port pollution and disaster, Anping Port Branch Office, Tainan City Environmental Protection Department, and South Maritime Affairs Center-Anping MPD. A grievance channel has been put into place for reporting or contact by members of the public, ship companies, or other relevant organizations. Regarding catastrophic events such as vessel or fire explosions, the Port triggers emergency response procedure to cope with disastrous incidence.

Involvement and Cooperation

06/

Port of Anping has established best practices for issues concerning the port environment, which include (1) Mangrove Conservation and Restoration ; (2) Enclosed handling facilities for bulk cargo. In addition, the proposed example of best practices can be incorporated into the database of the ECO Sustainable Logistic Chain as a reference for other EcoPorts.

6.1.1 Mangrove Conservation and Restoration

Environmental issue : Soil, Water Quality, Relationship with local community

Straight plantation of *Rhizophora stylosa* (stilted mangrove) seedlings in transitional zone

Content

Strategies : Exemplifying, Enabling

Attention/Motives

To prevent development at Anping Port from damaging the original mangrove habitat and in the interests of environmental protection, ecological conservation, and

sustainable development, TIPC developed a site to restore the mangrove forest and implemented a plan for ecological transplantation.

Solutions

According to the mangrove operational management plan in the environmental assessment report, the survival rate for mature mangrove transplantation is low and the required expense is enormous. In accordance with the recommendations of experts

and scholars, we opted to use seedlings instead, finding restoration efforts in favorable locations within the port district to avoid issues with oil pollution and algal blooms, and employed PVC piping to enable plantation in deep water areas.

Implementation/Timeline

1998-2002 Phase1 and 2 restoration and monitoring plans

2002-2004 Phase3 restoration and monitoring plans

Investment amount(NTD)

Year	Item	Cost
1994	Construction of stainless steel perimeter fence	3.97million dollars
1994	Transplantation and dredging expenditures	20.19 million dollars
1995	Construction of open fencing	2.1 million dollars
1998	Initial restoration expenditure	4.38 million dollars
2015	Environmental maintenance expenditures	92 thousand dollars
2016	Environmental maintenance expenditures	105 thousand dollars

Effect/Benefits

- Mangroves have important environmental protection functions. They act as windbreaks, protect embankments from erosion, and remove pollutants.
- Mangroves provide conservation, educational, and economic benefits.

- The port was invited by CIRAD (French Agricultural Research Centre for International Development) to publish the initial results in the journal Bois et Forêts des Tropiques (BFT) in 2002.

Participating Units

National Pingtung University of Science and Technology; National Chung Hsing University; Anping Port Branch Office, Port of Kaohsiung, Taiwan International Ports Corporation; Environmental Protection Bureau, Tainan City Government.

Stakeholders

Anping Port Branch Office, Port of Kaohsiung, Taiwan International Ports Corporation; Environmental Protection Bureau, Tainan City Government; neighboring residents of Anping Port; visitors to Anping Port.

6.1.2 Enclosed handling facilities for bulk cargo

Environmental issue : Air Quality,Dust

Strategies : Exemplifying, Enabling

Content

Attention/Motives

Docks number 28 to 31 (presently numbers 13 to 16) are bulk cargo stevedoring operations docks. Stevedore cargo handling frequently generates particulate matter pollution from coal and gravel operations and bulk cement

clinkers. Without the implementation of relevant air pollution prevention measures, this would lead to the dispersal of particulate matter air pollutants and affect the air quality of the port district and nearby residential areas.

Solutions

In order to reduce the dispersal of particulate matter pollutants caused by port district stevedoring operations; meet the need for dedicated rear dock bulk cargo operations in docks number 29, 30, and 31 (presently numbers 13 to 15); increase efficiency in the unloading facility; provide

secure cargo storage; and increase operational capacity, Logistics Co., LTD installed an enclosed coal unloading system, dust proof nets, and water curtains in accordance with regulations to lower particulate matter pollution to minimum levels.

Implementation/Timeline

Planning started in December, 2011

Fully operational after completion in November, 2015

Investment amount(NTD)

Civil engineering facility	64,057,637 dollars
Electromechanical machinery and equipment	26,251,591 dollars

Effect/Benefits

● Environmental benefits: The enclosed unloading facilities at docks number 29 to 31 were constructed and installed in accordance with regulatory specifications, allowing for effective reductions in particulate matter air pollution during the stevedoring process and helping improve air quality in the Tainan area.

● The adoption of RC processing at the work site has resulted in a marked decrease in incidents of soil contamination.

Participating Units

Anping Port Branch Office, Port of Kaohsiung, Taiwan International Ports Corporation ; Rich Logistics CO.,LTD.

Stakeholders

Shipping industry, transport operators, stevedore, Tenants

>> Comparison table of traditional grapple and enclosed unloading system operating formats

Stevedoring facility specifications	Description of traditional grapple operations	Description of enclosed unloading system
Unloading capacity (ton/hr)	About 600 tons/hr (4 derricks * 150 tons/derrick-hr)	Speed of ship unloader: 800 tons/hr(unloading = warehousing, not affected by number of vehicles; Speed of conveyer: 1200 to 1400 tons/hr)
Offloading capacity(ton/hr)	About 600 tons/hr (4 derricks * 150 tons/derrick-hr)	About 900 tons/hr (3 lines * 300 tons/per line-hour)

6.2 Involvement and Collaboration

The Anping Port Branch Office has been very active in collaborating with the private sector, public sector and academia in Taiwan and abroad on issues related to the environment. In addition to understanding environmental development

trends in the international arena, the Port of Kaohsiung also works to achieve the goal of becoming a sustainable green port through technological cooperation, joint venture, joint investigation and seminars.

Participation organizations

Public sector

Environmental Protection Bureau of Tainan City Government

The Tainan City Government EPB held its 2015 Tainan City Environmental Pollution Incident Response Drill, 2016 National Hazardous Chemicals Emergency Response Drill, and 2017 Tainan City Environmental Pollution Incident Response and Rescue Integrated Drill at the northern seawall beach of Anping Commercial Port to improve its environmental pollution emergency response capabilities. The Tainan City Government declared Anping Commercial Port a Clean Air Zone in 2016 and required all vehicles entering and exiting the port to obtain a self-regulatory label.

台南市政府 觀光旅遊局 Tour.tainan.gov.tw

Tourism Bureau of Tainan City Government

The Tainan City Tourism Bureau held its soft opening of Anping One at the Anping Port District in 2017. Tourists can now enjoy harbor views and experience the beauty of Anping by joining one of its yacht tours. To promote these sightseeing cruises, new routes were opened for investment in 2016. One operator's application has already been approved, and service will be opened in three stages.

Southern Taiwan Service Center of MPB, MOTC

The South Taiwan Maritime Affairs Center of the MPB under the MOTC is in charge of the affairs related to port security, disaster relief, and pollution control in the Port of Anping, as well as the implementation of laws and regulations, gathering of evidence, and penalty consideration. The Anping Port Branch Office cooperates with the South Taiwan Maritime Affairs Center to conduct land-water inspection in the port.

Bureau of Economic Development, Tainan City Government.

In order to revitalize investment in Anping Port, the Tainan City Bureau of Economic Development and TIPC strengthened port construction, opened new shipping routes, and improved port infrastructure through a smart logistics strategy. The completion and opening of Terminal 10, a multipurpose port terminal, in 2016 was beneficial to cargo stevedoring operations. It integrated Tainan City's agricultural and industrial zones and developed a combined sales/production business model.

Tainan City Government

The Tainan Ancient Capital International Marathon was organized by the Tainan City Government and is famous for the concentration of historical sites along the route. For the 2017 run, the city government invited Taiwan International Ports Corporation to collaborate in planning the route. The result was that in addition to the historical sites and scenic areas that were part of the 2016 run, the usually restricted Anping Port was also opened to runners for the first time, allowing them to enjoy the beautiful seascape. In order to promote the development of tourism in Anping's Commercial Port, the Taiwan International Ports Corporation organized the Anping Port Yacht Harbor Area and Large-Scale Shopping Mall Planning Forum with the Tainan City Government in 2016.

Academic Institution

Cheng Shiu University

The implementation of the 2015 Environmental Monitoring Plan, a subsection of Anping Port's overall plan, includes biannual analysis of harbor area terrain features and cross sectional water depth analysis, annual marine status observations, water quality, substrate, noise vibration, and marine life monitoring.

Association

Taiwan Fishing Right Organization

The Taiwan Fishing Rights Organization organized the 2nd Tainan City Mayor's Cup National Invitational Fishing Tournament and Ocean Fishing Resources Conservation Fish Fry Release Event at the south seawall of Anping Commercial Port in the hope that by participating in seaside recreational activities, the public will learn to treasure marine resources, develop appropriate attitudes toward marine fishing, and not litter or pollute the ocean.

National Cheng Kung University

The 2014 International Creative Industries Day Exhibition was organized by National Cheng Kung University's Institute of Creative Industries Design. After visiting Anping, foreign students at National Cheng Kung University proposed the idea of reinventing the space using public art as medium to promote Anping Port as a sightseeing destination. The port commissioned National Cheng Kung University to conduct land and harbor groundwater quality and sediment/soil testing in 2015. The school also participated in the Anping Port Yacht Harbor Area and Large-Scale Shopping Mall Planning Forum in August, 2015.

Training

07/

07/

Training

7. Training

In compliance with its environmental policies, the Anping Port Branch Office provides suitable environmental education and training programs to improve staff's environmental awareness, enhance their environmental protection knowledge and improve the competitiveness of the Port of Anping.

In 2015 and 2016, the Anping Port Branch Office organized environmental education courses for internal staff members. The courses included: pollution prevention, natural disaster, environmental impact assessment and ecological education.

Environmental education courses (Video)

Course title: Emerging Infectious Diseases (Introduction to and Prevention of Ebola and Novel Influenza A Virus Infections).

Anping Port Branch
Office FB Pages

To present the achievements of TIPC in promoting green ports, Chinese and English web pages have been set up on our website. These web pages can also enhance communication between Taiwan and other countries.

Anping Port Branch Office, the general public and consumers can provide us with their feedback through the e-mail information on "contact us".

Port district event information is shared to create a closer bond between Anping Port and the public.

Seminars/Conference

Declaration of greenhouse
gases inventory

Through self-regulation, Anping Port passed the Greenhouse Gas Inventory Verification, increased its energy efficiency and reduced environmental pollution.

Travel Light Shuttle Bus No.
17 Links up Anping Port and
Hsingta Port

Tainan's City Transportation Bureau established Shuttle Bus No. 17 as a convenient holiday link between Anping Port in Tainan and Hsingta Port in Kaohsiung, allowing tourists to experience in-depth tours of historical spots at Anping Port and enjoy delicious seafood at Hsingta Port all in the same day.

The canoe route travels through the section of Anping Port that is in the ocean current impact zone. Rising and falling of waves test the willpower and balance of participants and provide a chance for the teens to challenge themselves and build endurance.

The Anping Port Yacht Harbor
Area and Large-Scale
Shopping Mall Planning
Forum.

It was organized in conjunction with the Tainan City Government in hopes of formulating the best and most feasible development project. Representatives from industry, the government, and the academic sphere were invited to brainstorm and come up with creative ideas.

Germany's MV Logos Hope
(known as the world's
largest floating bookstore)

The ship berthed at Anping Port in September, 2014 and opened its onboard book fair to the public for 4 days. The estimated total number of visits was 88,440 and the highest number of visits on a single day was 28,931, breaking the world record of 24,000 visits on a single day during the MV Doulos' visit to Sri Lanka.

The TV program Taiwan
Fishing, shot at Anping Port.

Activities

The Navy's Friendship
Fleet Visits Anping Port

The Navy's Friendship Fleet Training Detachment berthed at Anping Port and showcased its newest and largest Panshih fuel and ammunition supply ship, one La Fayette class ship, and two new missile boats.

The 11th Tainan Ancient
Capital International
Marathon

More than 8000 domestic and foreign participants entered Anping Port for the Tainan Ancient Capital International Marathon. About 8.5 kilometers of the run took place in the port district. The route ran across Anping Commercial Port's Chuhsi, Hsinkang, and Yukuang bridges. These three bridges link up the entire port district and one can enjoy the changing scenery and views of the port district from the bridges.

9.1 Environmental costs

Regarding the environmental issues, the Anping Port Branch Office has spent funds on their employees, environmental maintenance, management, environmental monitoring, publications, emergency response and communication, with the aim of enhancing employees' environmental awareness and

environmental maintenance, to improve environmental quality and ability of emergency response, and to increase the public's understanding of the port.

The Summation of Costs invested by the Investments of the Anping Port Branch Office in the Environmental Aspects is €378,961 in 2015 and €423,146 in 2016.

Environmental investments in the Anping Port

- Staff: Costs for environment-related staff and training.
- Environmental maintenance and management: Port greening and beautification, waste disposal, and dredging.
- Environmental Monitoring: Monitoring the air, noise, water, sediment, dredging as well as environmental patrol
- Emergency response: Charges for handling accidents, materials for pollution in the port, and charges for testing dangerous goods.
- Communication and publications: Website maintenance, promotional activities, and environmental publications.

>> Costs related to Environmental Issues, Anping Port Branch Office in 2015 (Unit: €)

Item of Expense		2015
Staff	Cost of environment-related personnel	105,106
	Training costs	0
	Subtotal	105,106
Environmental maintenance and management	Outsourced spending for port garbage disposal	163,537
	Port greening (plantation and maintenance) and beautification	2,138
	Consultant fees of the construction and management operations	29,191
	Subtotal	194,866
Environmental Monitoring	Test request fee	75,932
Emergency Respose	Port disaster drill expenses	294
Communication and Publication	Welfare expenditure (for networking with neighboring communities)	2,762
Total		378,961

>> Costs related to Environmental Issues, Anping Port Branch Office in 2016 (Unit: €)

Item of Expense		2016
Staff	Cost of environment-related personnel	78,755
	Training costs	418
	Subtotal	79,173
Environmental Maintenance & Management	Outsourced spending for port garbage disposal	248,317
	Port greening (plantation and maintenance) and beautification	5,867
	Consultant fees of the construction and management operations	2,624

南自貿

Anping Port became an international commercial port in 1997 and positioned itself as an international bulk cargo importing and exporting port with tourism and recreational functions. The port successfully reinvented itself, supplementing its gravel unloading operations with the dual goals of developing free trade to the south and tourism from northern regions. Free trade operations were established in conjunction with a free trade harbor, a maritime courier zone, an agricultural products distribution center, and the provision of cargo operating services to effectively increase free trade zone efficiency. Tourism from northern regions was encouraged by combining port tourism with local urban culture and the promotion of the yacht harbor area, Yukuang Island, Crescent Moon Bay, and other recreational industry businesses to shape a seaport environment where visitors can enjoy leisure activities.

As an international port operator, Anping Port fully understands the importance of operating an ecofriendly port. The port has initiated many port district environmental protection projects since the early days of its inception, including a mangrove restoration project, enclosed cargo handling operations, the construction of an onshore power facility, and the formulation of air quality zones. Since its certification as an International Eco Port, besides exchanging information on the latest green port construction measures and best management practices with other green ports around the world, Anping Port plans to implement the eco port philosophy in future port district land developing planning. For example, the North Tourism Zone development project will adopt a low density, low carbon development philosophy, including the construction of a low carbon waterfront eco island, to promote the establishment of a green, sustainable, advanced top quality port destination.
